

Formulas and Tables

1. Standard deviation:

$$\sigma = \sqrt{\frac{\sum (X_i - \bar{X})^2}{n - 1}}$$

2. z-score: If X is drawn from a normal distribution, with mean μ , and standard deviation σ , its corresponding z-score is:

$$z = \frac{X - \mu}{\sigma}$$

3. Standard deviation for a proportion, π :

$$\sigma_\pi = \sqrt{\pi(1 - \pi)}$$

4. Sample standard error, SE, depends on sample standard deviation, s , and sample size, n :

$$SE = \frac{s}{\sqrt{n}}$$

5. Confidence interval around point estimate, ϵ , where z is the z-score for the required level of confidence, and SE the standard error (note: z-score may be derived from standard normal distribution or t -distribution, as appropriate):

$$\epsilon \pm z \times SE$$

6. Chi-squared statistic for a table,

$$X^2 = \sum \frac{(O - E)^2}{E}$$

where O is the observed value and E the expected value.

7. Expected value under independence in a table:

$$E = \frac{rc}{T}$$

where r is the row total and c the column total for that cell, and T the grand total for the table.

8. Predicted value from a bi-variate regression, where a is the constant and b the slope coefficient:

$$\hat{Y} = a + bx$$

9. Standard error for comparing means of two sub-samples, whose variance may not be the same:

$$\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$$

where s_i is the standard deviation for group i , and n_i the number of cases in group i .

Table of the Standard Normal Distribution
